Outline

- 1 What Is A Join Clause?
- 2 Types of SQL Joins
- 3 Examples
- 4 Questions?

What Is A Join Clause?

What Is A Join Clause?

- Combines records from two or more tables.
- Returns a set of records which can be saved as a table or used as is.
- Joins are probably the hardest core SQL skill to master.

Why Do We Have To Do This?

- Normalization:
 - Eliminates duplication of data.
 - Makes it easier to maintain data integrity, at the cost of speed.
- DOH DataMart is NOT consistently normalized:
 - Normalization deserves its own presentation.
 - Combines OLTP with Transactional Structures.
 - Sometimes easier. Sometimes Harder
 - Denormalized data == Mistakes.
 - Use normalized data structure unless data is COMPLETELY static.

Types of Joins

There are 5 ANSI joins, plus one special case that deserves additional discussion:

- 1 Cross Join
- 2 Inner Join
- 3 Left Outer Join
- 4 Right Outer Join
- 5 Full Outer Join
- 6 Self Join

- We need example data.
- The following two slides gives us two tables to use.
 - Yes, you can join more than two tables at a time.
- Keep track of these two table slides or you will get very lost.
- ALL SQL needed to produce the results in this presentation can be found in the data and sql folders, respectively.

Table: Departments

DEPT_ID	DEPT_NAME	DEPT_FLOOR
31	Sales	1
33	Engineering	3
34	Clerical	2
35	Marketing	3

Aliased as 'empl'.

Table: Employees

EID	DEPT_ID	LAST_NAME	FIRST_NAME	GENDER
1	31	Rafferty	Gerry	M
3	33	Jones	Jon	M
5	33	Heisenberg	Werner	M
7	34	Robinson	Elizabeth	F
9	34	Smith	Jefferson	M
11	NULL	Williams	Serena	F

Aliased as 'empl'.

The following protected words in SQL should START a clause.

- SELECT
- FROM
- WHERE
- HAVING

SQL Clauses

The following protected words in SQL should START a clause.

- SELECT
- FROM
- WHERE
- HAVING

Style:

- Align SQL Clauses
- Predicates should be indented consistently.

Cross Join: Discussion

- Returns the Cartesian product of the tables in the FROM clause.
- This is bad.
- These tables are tiny, so it doesn't really matter.
- But if you do this on a table like RECIP_PROFILE, you are going to get a nasty call from Samir.

Explicit Cross Join: Example

```
SELECT *  
FROM EMPLOYEES empl cross join DEPARTMENTS dept  
;
```

Inner Join: Discussion

```
select * from EMPLOYEES;
```

Inner Join: Example

Left Outer Join: Discussion
